Hydrofracking : what everyone needs to know

Hydraulic fracturing, informally referred to as “fracking,” is an oil and gas well development process that typically involves injecting water, sand, and chemicals under high pressure into a bedrock formation via the well. This process is intended to create new fractures in the rock as well as increase the size, extent, and connectivity of existing fractures.

What is hydraulic fracturing? - USGS.gov

HYDROFRACKING WELLS Hydrofracturing (or hydrofracking) is a process that may be used to increase the flow of water into a well. It is usually applied to low yielding wells. There are many instances of hydrofracturing resulting in increased yield for homeowners.

HYDROFRACKING WELLS | American Ground Water Trust

Hydrofracture is a generally effective common choice for remediation for a low flowing well system. An alternative to hydrofracturing could be to deepen the well in an effort to not only increase flow but increase the wells storage capacity.

Hydrofracture - Water Well Problems & Remediation in MA ...

Hydrofracking needs constant, direct oversight. When this is provided, it seems to provide an economic and societal boost. When it is not provided, harm happens to easily. With so much at stake, including the health of the workers, these specific issues should be debated before any hydrofracking is allowed to begin in a new community.

Pros and Cons of Hydrofracking | APECSEC.org

The composition of a hydrocracking catalyst depends on the final product requirements and mode of the operation (one or two-stage). A guideline of catalysts composition is shown in Table 7.13. In the first stage of a two-stage operation, a hydrocracking hydrogenation catalyst is usually used for hydrodesulphurization, hydrodenitrogenation and aromatics removal.
