JBoss Application Server

The JBoss Application Server ships with three server configurations. You can choose which configuration to start by passing the -c parameter to the server startup script. For instance, command run.sh -c all would start the server in the

all configuration. Each configuration is contained in a directory named JBOSS_HOME/server/[config name]/. You can look into each server configuration's directory to see the default services, applications, and libraries supported in the configuration.

Administration And Configuration

Guide - JBoss

JBoss EAP features a range of application deployment and configuration options to cater to both administrators and developers. For administrators, the management console and the management CLI offer ideal graphical and command-line interfaces to manage application deployment in a production

environment. For developers, the range of application deployment testing options include a configurable file system deployment scanner, the HTTP API, an IDE such as Red Hat JBoss Developer Studio, and Maven .
