The LM393 is functionally a comparator by design. It is configured as an open-collector device since its typical use is as a switch. You may find it easier to analyse the operation of your circuit if you consider it in that sense rather than as a (general-purpose) op-amp.

LM393 input common mode voltage range is 0 V to Vcc - 1.5 V. In the comments you say:-my triangle wave is going to the inverting pin (pin no -2) voltage is 4.5 volt for non inverting pin sin wave is going to the pin no -3, voltage is 5 volt , pin no-5 as VCC of LM393, 5 volts. 5 V - 1.5 V = 3.5 V.

LM393, LM393A 0 to 70 Notes: (1) The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than 0.3 V. The high end of the common-mode voltage range is (V CC +) - 1.5 V, but either or both inputs can go to 30 V without damage.

cheaper, a LM393 dual comparator. This chip sells for less than the 555, but don't let that fool you. In this app, its actually superior to the 555. 555's usually use a trimpot to adjust the voltage. They don't possess an internal voltage reference like the MAX1771 and MC34063.
