17.3.5 Mixed lubrication (ML) Mixed lubrication is a regime in which two or more lubrication mechanisms are

functioning spontaneously. There may be frequent contact, but some portion of the bearing surface remains supported by a partial hydrodynamic fluid film.

Hydrodynamic Lubrication - an overview | ScienceDirect Topics

In order for hydrodynamic lubrication to be successfully and completely applied, there must be a high degree of geometric conformity between the machine components (e.g., the curve of the shaft and the curve of the shell in a journal bearing are very similar) and a resulting low-contact pressure (100 to 300 psi in industrial journal bearings) between the surfaces in relative motion.

Lubrication Regimes Explained - Machinery Lubrication

In addition, under very heavy loads, slow relative speed, insufficient surface area and scarcity of lubricant, the formation of thick film necessary for hydrodynamic lubrication becomes difficult and

Mixed Lubrication in Hydrodynamic Bearings is the second part of a four part book series dedicated to hydrodynamic bearings. The first volume describes the physical properties of lubricants that play an essential role within the hydrodynamic process; ...

Likewise, at high speeds (about 4,000 ft. per minute or greater), oil rings struggle to deliver enough oil to fully lubricate the bearing. A large difference in shaft and oil ring rotation speed prevents the oil rings from delivering adequate oil to the bearing, resulting in mixed-film or boundary lubrication.

Lubrication reduces friction between the moving surfaces or rolling pairs. Some of the various types include hydrodynamic, hydrostatic, boundary and extreme pressure lubrication. The lubricant also act as a coolant carrying heat away from the sliding surfaces so it is necessary for all the moving parts in machinery or engine operation.

hydrodynamic journal bearings in which shafts rotate within a supporting sleeve. In short, journal bearing wear reduces the efficiency of all these machines and

numerous starts and stops can cause them to fail prematurely. Example of Journal Bearing Issue . An example of the issues caused by journal bearing wear at the mixed or boundary lubrication

In the hydrodynamic regime the journal "climbs" in the rotation direction (left side of the bearing). If the journal works in boundary and mixed lubrication the hydrodynamic pressure force disappears (the other two forces remain). Thus, the "climbing" direction is opposite to the

Mixed lubrication is an operating state (regime) of a lubricated contact in which surface roughness (Surface Roughness) significantly affects the performance of the contact. It may occur with conformal contact lubrication, such as journal bearing lubrication. Traditionally, as suggested by the term mixed, it is thought that both hydrodynamic lubrication and asperity contact have to be present ...

or by a more complex calculation of topography. A high λ value ($\lambda > 3$) indicates the hydrodynamic lubrication where no metal-to-metal asperity contact happens. Generally, the smooth surface approximation in the oil film thickness prediction is valid when λ is large and when there is no oil starvation. Mixed lubrication occurs when $\lambda = 1 \sim 3$ (most authors believe it takes place at about $\lambda = 3$).
