The use of computational techniques is increasing day by day in the manufacturing sector. Process modeling and optimization with the help of computers can reduce expensive and time consuming experiments for manufacturing good quality products. Metal forming and machining are two prominent

Modeling of Metal Forming and Machining Processes - by ...

Sheet metal forming processes include deep drawing, bending, and spinning. Coining, flow forming, and ironing are examples of sheet-bulk metal forming. Modeling of metal forming started since the beginning of the 20th century. Initial attempts were directed to estimate the load required for plastic deformation.

Two prominent methods of converting raw material into a product have been metal forming and machining. Metal forming involves changing the shape of the material by permanent plastic deformation. After converting non-porous metal into product form by metal forming processes, the mass as well as the volume remains unchanged. However, in the case of metal forming of porous metal, volume does not remain unchanged.

Metal Forming and Machining Processes | SpringerLink

The main input data that is used to define a metal forming process model are: † A description of the way the material deforms and its failure (the material model). † The geometry of the component to be manufactured. † The boundary conditions of the model.

Material Characterisation for Metal Forming Simulation

A somewhat more refined modeling technique for the estimation of forces in metal forming is slip-line method, which considers a pair of orthogonal curves representing the maximum shear stress lines. Equilibrium equations, incompressibility relation, yield criterion, stress-strain relations and boundary conditions determine the stress distribution during the process.

Incorporation of material behavior in modeling of metal ...

Forming, metal forming, is the metalworking process of fashioning metal parts and objects through mechanical deformation; the workpiece is reshaped without adding or removing material, and its mass remains unchanged. Forming operates on the materials science principle of plastic deformation, where the physical shape of a material is permanently deformed.

The physics of metal forming and metal removing is normally expressed using non-linear partial differential equations which can be solved using the finite element method (FEM). However, when the process parameters are uncertain and/or the physics of the process is not well understood, soft computing techniques can be used with FEM or alone to model the process.

In finite element simulations of sheet metal forming problems, the material is usually assumed to be elastoplastic-hardening material and the strain rate effects, when considered, are used in the definition of the flow curves. For the numerical modeling of mechanical behavior of sheet metals, the following four questions must be answered:
