Snijders (2001) describes a method for non-parametric scale analysis of two-level data. The nesting structure is defined by "subjects" (level-one units) being nested in "objects" (level-two units). Each subject provides responses on a set of m dichotomous items with regard to the object in which this subject is nested.

Multilevel Theories, Multistage Sampling, and Multilevel Models: Phenomena and data sets in the social sciences often have a multilevel structure. This may be reflected in the design of data collection: simple random sampling is often not a very cost-efficient strategy, and multistage samples may be more efficient instead.
