The output of the smps is regulated by means of PWM (Pulse-Width-Modulation). As given in the circuit above, the switch can be driven by the PWM-oscillator, such that the power delivered to the step-down transformer is controlled indirectly, & hence, the output is controlled by the pulse-width-

modulation, as this pulse-width signal & the output-voltage are inversely related to each other.

The working of SMPS can be understood by the following figure. Let us try to understand what happens at each stage of SMPS circuit. Input Stage. The AC input supply signal 50 Hz is given directly to the rectifier and filter circuit combination without using any transformer.

Fig. 3: Simple Circuit Diagram Of Switched Mode Power Supply The major feature of SMPS is the elimination of physically massive power transformers and other power line magnetic. The net result is smaller, lighter package and reduced manufacturing cost, reducing primarily from the elimination of the 50 Hz components.

SMPS (Switched Mode Power Supply) : An Overview

The output power of the SMPS is 7.48 W. This design provides an extremely safe mode of operation during an output short-circuit in which case the output voltage is close to zero, while the output current is fixed to a constant value.
